Aluminum Decking with a Thick Comfort Coating
The Versadeck™ aluminum decking polyurea deck coating is thick, durable, slip resistant and comfortable to walk on in the hot sun. This deck coating is the difference that sets Versadeck™ Decking apart from the competition. Homeowners love the rich look and feel without the pinging sound associated with other aluminum decking products. Architects prefer Versadeck™ Decking because they know that the combination of structural aluminum with perhaps the highest performance protective coating available means Versadeck™ Polyurea Coated Decking will out perform the competition.

High Performance Polyurea Protective Deck Coating
The Versadeck™ protective polyurea deck coating is formulated for exceptional durability and color stability. It exhibits outstanding advancements in physical and mechanical properties in tensile, tear, and elongation, with an abrasion resistance that is outstanding. The Versadeck™ Polyurea coating is also environmentally responsible containing zero V. O. C's and no solvents.

Eight Beautiful Polyurea Coating Deck Colors
Versadeck™ aluminum decking is available in eight fade resistant decking colors; Rustic Brown, Cherry Brown, Dark Slate Gray, Light Slate Grey, Light Clay, Beige, Taupe and Terra Cotta Red. These colors are driven by and formulated with UV stable pigments and have stood the test of real time. Custom colors are available as a special order request.

The New Deck Look
Versadeck™ Polyurea coating is formulated using amine terminated polyether resins, amine chain extenders, aliphatic and aromatic prepolymer. This highly cross-linked elastomer is a two component mixture that is heated and mixed utilizing hydraulic pressure. When applied to Versadeck™ aluminum decking, the compounds cross-linking curing process results in an extremely non-porous glossy finish. The glossy finish is only temporary and it is initially a common result with Polyurea and Epoxy coatings.

The Weathered Deck Look
Versadeck™ coated aluminum decking actually improves in looks and durability as it ages. Complete polymerization to achieve final strength can take several weeks. The product can be shipped and handled during this time but it will hold a shine until it is fully polymerized and the surface has gone through its early oxidation stage which occurs during exposure to the elements. Soon after installation the gloss goes away transforming to an appealing natural weathered look.

Perception of Deck Colors and Color Drifting
There are several factors that can effect the way colors can look. Depending on the color, dirt that accumulates on the surface can shift the color to be preserved as a darker or lighter shade. Textures can also play a part in the deck color perception. Textures create shadows which combine with light and dirt differently (standard and coarse textures look different in the sun light and when dirty). The Polyurea coating is extremely UV stable and resistant to fading but will drift in color over time. As with all materials, with high exposure to the sun over long periods of time, the color may drift a few shades. This gradual change is generally unnoticed as its surroundings may also drift in color.

Versadeck™ Polyurea Deck Coating Thicknesses
Aluminum flooring alone provides a multitude of structural advantages. Combining this advantage with a superior coating, truly defines the overall performance of the product. After all, the coating provides the color, comfort and durability. 60-80 mil thick Polyurea coating is backed by a limited lifetime transferable warranty.

Three Skid Resistant Non-Slip Deck Coating Textures
The Versadeck™ thick polyurea coating is available in three slip-resistant decking textures. Texture-1 (standard coating) fits most applications, Texture-2 and 3 offer extra non-slip deck options ideal for stair applications and ramps.

*The coating colors shown here or on our site, not clearly represent the actual color. Printers and computer monitors display colors differently. Request color samples for a closer representation.
